

CLINKT CASE INVESTIGATION — FINDINGS REPORT

Where Clinkt's Revenue Goes to Die

An evidence-driven investigation into why customers arrive with intent, add products to their carts, and then vanish — and what Clinkt must fix to survive.

Our Verdict: Clinkt is losing **₹84,857 in abandoned cart revenue** — 1.75× its actual earned revenue — due to three interconnected failures: a **broken recommendation engine** that shows irrelevant products, **chronic inventory mismanagement** that leaves high-demand items understocked, and a **fractured customer journey** where 73.1% of sessions end without a purchase. These are not three separate problems. They are one failure loop that feeds itself.

FINDING 01

The Failure Loop

These aren't three problems. They're one loop. Bad recommendations → customers can't find what they want → the wrong products get stocked → customers abandon → repeat.

70.5%

Cart Abandonment Rate

₹84,857

Revenue Lost to Abandonment

₹48,412

Actual Revenue Earned

● **Bad Recommendations** → Customers see irrelevant products (Home Care: 15.5% views, 9.0% orders)

● **Wrong Stock Priorities** → High-demand items chronically understocked (60.7% days sub-optimal)

● **Customers Abandon** → 70.5% of cart items never purchased (666 of 945)

● **No Learning** → Demand signals ignored → Loop repeats → Orders decline (-21.2%)

Why This Matters

If Clinkt recovered just **half** of its abandoned cart revenue, total revenue would jump from ₹48,412 to **₹90,841** — an **87.6% increase** — without acquiring a single new customer. The customers are already here. They're already interested. Clinkt is simply failing to close.

FINDING 02 — EVIDENCE CHAIN

Customers Disappear at Every Stage

The conversion funnel leaks at two critical points: View → Cart (65.1% drop) and Cart → Order (70.5% drop).

OBSERVATION

2,708 product views across **811** sessions in August 2026. Customers are arriving — traffic is not the problem.

📁 customer_interactions.csv → Interaction_Type = 'View'

MEASUREMENT

Only **34.9%** of views result in an add-to-cart. **547** sessions add items, producing **945** cart additions.

📁 customer_interactions.csv → Interaction_Type = 'Add_to_Cart'

CRITICAL DROP

Of those 945 cart items, only **279** become orders (**29.5%**). The other **666** items are abandoned — worth **₹84,857**.

📁 orders.csv ↔ customer_interactions.csv (Session_ID + Product_ID join)

SEGMENT BREAKDOWN

SEGMENT	ABANDONED	ORDERED	ABANDONMENT RATE	AOV
Family	174	45	79.5%	₹192.60
Budget	150	53	73.9%	₹151.45
Premium	84	43	66.1%	₹151.07
Regular	258	138	65.2%	₹182.77

exports/6_abandonment_by_segment.xlsx

Interactive Dashboard

Storefront Prototype

RULED OUT: PRICE

Average price of abandoned items: **₹127.41** vs ordered items: **₹123.63** .

The difference is negligible — price is **not** the primary driver of abandonment.

products.csv → Price | orders.csv → Unit_Price

FINDING 03 — EVIDENCE CHAIN

Inventory Is Blind to Demand

Products customers want most are the ones most likely to be out of stock. Historical purchase data exists to predict demand — it's being ignored.

OBSERVATION

60.7% of product-days (677 of 1,116) are at sub-optimal stock levels. Only 39.3% of days have healthy stock (Closing_Stock > 15).

 [inventory.csv](#) → [Stock_Status distribution](#)

DEMAND-STOCK MISMATCH

The **highest-demand product** — Instant Noodles 4-Pack (demand score: 481) — spent

11 days in critical stock and **0 days** at healthy levels across the entire month.

PRODUCT	DEMAND SCORE	CRITICAL DAYS	HEALTHY DAYS
Instant Noodles 4-Pack	481 (highest)	11	0
Bath Soap 4-Pack	221	9	0
Pasta 500 g	202	1	0

 [exports/investigation_2_inventory_vs_demand.xlsx](#)

REVENUE LOST BY STOCK STATUS

Abandoned carts broken down by stock status at time of abandonment:

STOCK STATUS	ABANDONED REVENUE	COUNT
Low Stock	₹52,352	376
Healthy	₹24,086	237
Critical	₹7,124	46
Out of Stock	₹1,295	7

📁 [exports/12_abandoned_revenue_by_stock.xlsx](#)

Interactive Dashboard

Storefront Prototype

RULED OUT: OVERALL SUPPLY SHORTAGE

Stock isn't universally low — some products like Cola 750ml and Cookies 200g maintain healthy stock for 31/31 days while high-demand items starve. This is a **prioritization failure**, not a supply failure.

📁 [inventory.csv](#) → [Product-level Stock_Status breakdown](#)

FINDING 04 — EVIDENCE CHAIN

The Recommendation Engine Is Broken

Products being surfaced to customers don't match what they actually want to buy. The View-to-Order gap reveals what's being shown vs what converts.

OBSERVATION

Home Care receives **15.5%** of all views but only **9.0%** of orders — a **6.5 percentage point gap**. Meanwhile, **Staples & Grains** gets only 8.3% of views but 11.5% of orders.

[exports/investigation_3_recommendation_gap.xlsx](#)

WORST CONVERTING PRODUCTS GET MOST VIEWS

Laundry Detergent — 209 views but only 21.5% view-to-cart rate. **Tomatoes** — 78 views, 20.5% conversion. These are being pushed by the platform but customers aren't buying them.

Meanwhile, products like **Toor Dal 1 kg** convert at high rates but get fewer views — they're being hidden.

[exports/investigation_1_product_funnel.xlsx → View_to_Cart_Rate](#)

SESSION BOUNCE EVIDENCE

264 sessions (32.6%) are **view-only** — the customer browses and leaves without adding anything to cart. Average duration: just **1.4 minutes**.

Compare this to sessions that order: **9.4 minutes** average. Customers who find relevant products engage 6.7× longer.

[exports/investigation_4_session_journeys.xlsx](#)

RULED OUT: CATEGORY MISMATCH

In sessions that DO result in orders, 100% of ordered categories were previously viewed. This means when the right product IS shown, customers DO buy. The problem is that **too**

many sessions never show the right product.

FINDING 05 — EVIDENCE CHAIN

The Decline Is Already Happening

Orders are trending downward. Repeat purchase rates are weak outside the Regular segment. The failure loop is accelerating customer loss.

ORDER TREND

Order volume over August shows a **-0.212** correlation — a **negative trend**.

Revenue correlation: **-0.147**. Both orders and revenue are declining week over week.

 [exports/investigation_5_daily_trends.xlsx](#)

REPEAT PURCHASE FAILURE

SEGMENT	REPEAT RATE	AVG ORDERS	AVG SPEND
Budget	35.5%	1.7	₹259
Family	42.3%	1.7	₹333
Premium	64.7%	2.5	₹382
Regular	60.9%	3.0	₹548

Budget and **Family** segments — making up 53% of customers — have repeat rates below 45%. These customers try Clinkt once and don't come back.

 [exports/investigation_5_repeat_purchases.xlsx](#)

CITY-LEVEL DISPARITY

Kolhapur converts at only **19.0%** vs **Aurangabad** at **36.9%**. Nearly 2× difference. Tier-2 cities with potentially less inventory depth are underserved.

 [exports/investigation_4_session_journeys.xlsx](#) → City groupby

RECOMMENDATIONS

What Clinkt Should Do

Three interventions, ordered by expected impact and implementation speed.

Immediate — Fix Inventory Prioritization (Week 1-2)

1. **Implement demand-score-based replenishment.** Use View + Cart signals (not just past sales) to predict restock needs. Instant Noodles, Orange Juice, and Bath Soap should never hit critical stock again.
2. **Set per-product dynamic stock thresholds.** A "Low Stock" of 10 units for a high-velocity item like Instant Noodles is a stockout in disguise. Thresholds should scale with demand velocity.
3. **Prioritize high-AOV cities (Mumbai, Navi Mumbai)** with deeper inventory — they generate the most revenue per order.

Short-Term — Rebuild Recommendations (Week 2-4)

1. **Reduce Home Care and Personal Care prominence** in recommendations — they get disproportionate views but convert poorly (6.5% and 2.3% view-order gaps).
2. **Boost Staples & Grains and Fresh Produce** — these are under-surfaced but over-ordered, proving latent demand.
3. **Target Family segment specifically** — they have the worst abandonment (79.5%) but highest AOV (₹192). A dedicated "Family Essentials" recommendation module could recapture significant revenue.

Medium-Term — Close the Loop (Month 2-3)

1. **Cart recovery system** — 329 sessions add to cart but don't order. Even a simple notification system recovering 20% would add ~₹17K/month revenue.
2. **Feed cart and view data INTO inventory planning.** If 63 customers added Orange Juice to cart this month, next month's opening stock should reflect that demand — not just units_sold.
3. **Segment-specific pricing and bundles** — Budget segment has 35.5% repeat rate. Test basket discounts to pull them back.
